

Abstract

A circuit arrangement for a reception part of an SDH transmission system for transmitting plesiochronous signals contains input channels assigned to these signals which are connected to a clock synchronizer for the adaptation of the plesiochronous signals to a common processing clock. The clock synchronizer is followed by a multiplexer, to the output of which a reception processing means is connected for the transformation of a plesiochronous signal into a synchronous signal for an SDH transmission channel. A circuit arrangement for a transmission part of the SDH transmission system contains a multiplexer, to the output of which a transmission processing means (is connected for the conversion of a transmitted synchronous signal into a plesiochronous signal. By means of a desynchronizer following the transmission processing means the plesiochronous signal clocks are recovered, and the plesiochronous signals are issued to the output channels assigned to them.
